ABSTRACT: The microbial pigments have more applications than synthetic pigments and are easily biodegradable and safe to use. Among all bacteria, the anoxygenic phototrophic purple non-sulfur bacteria have more applications and can synthesize different pigments. In this present study, bacterial carotenoids were isolated from the two novel strains of *Rhodospseudomonas palustris* and evaluated its applications. The antibacterial activity was studied by zone inhibition method. The pigment A1 and A2 showed more antibacterial activity against gram-negative and gram-positive bacteria. *In-vitro* antioxidant activity of bacterial pigments and bacterial extracts were evaluated by DPPH assay. The pigment A2 and Rp. KRPR02 showed more radical scavenging activity. The percentage inhibition of DPPH radical for pigment A2 (82.74 ± 4.49) and bacterial extract of Rp. KRPR02 bacteria (83.33 ± 5.46) is almost nearer to the percentage inhibition of DPPH radical for standard (ascorbic acid) which is 96.41 ± 1.81 . *In-vitro* cytotoxic activity was studied by MTT assay and found that the pigments showed cytotoxic activity against the HeLa cell line, DU145 cell line, MCF7 cell line and Miaapaca -2 cell line. The pigments were found to have significant antibacterial, antioxidant and cytotoxic activity, thus can be used as potential biological agents in medicine.

INTRODUCTION: Pigments are colorants which are produced from plants, animals, microorganisms and can also be synthesized by chemicals synthetically. The pigments have many applications in industries¹ (food, textile, paper, cosmetic, plastic, paint) agriculture, biology^{2,3,4} (antibiotics, antimicrobial agents, anticancer agents) etc. Now a day's pigments produced from the living organisms gained more importance as the synthetic pigments are toxic and show harmful effects like carcinogenicity⁵, mutagenicity⁶, teratogenicity, genotoxicity⁷, cytotoxicity, neurotoxicity and have harmful impact on the ecosystem.

The microbial productions of pigments are in many ways superior to the pigments produced from the plants and animal sources due to several reasons such as their rapid growth rate, easy downstream processing, cost-effectiveness, independent of season and geographical conditions, controllable, more stable and safe to use^{8,9}. Microbial pigments can be produced from bacteria, algae, fungi and protozoa.

Pigments produced from microbes possessing different shades of colors like yellow, purple, pink, orange, bluish red, red pigments etc. Microorganisms produce various pigments like carotenoids, bacteriochlorophylls a & b, melanins, flavonoids, quinines, prodigiosins, phenazines and more specifically monascins, violacein or indigo¹⁰. They possess various biological activities like antioxidant, antimicrobial, anticancer, anti-inflammatory, antiproliferative, anti-obesity and are used as bio-indicators^{11,12}.

ABSTRACT

Pulsatile drug delivery systems are time controlled release systems which releases the active pharmaceutical ingredient in preprogrammed time after a predetermined lag time. Chronotherapeutics is a discipline of science which deals with treatment of disease based on circadian rhythm and pathological state of disease. The aim of the present work was to develop and evaluate oral pulsatile delivery system of Anti-inflammatory drug, Celecoxib. Pulsatile drug delivery systems release the drug after fixed lag time in CVS disorders, diabetes mellitus, bronchial asthma, rheumatoid arthritis and ulcers. Celecoxib is a NSAID used in relieving of pain in rheumatoid arthritis. Pulsatile tablets consists of core and coat layers. Core tablets were prepared

using super disintegrant and core tablets were then pressed with release rate retarding polymers. Drug and excipient compatibility was carried out by using FTIR studies. Press coated pulsatile release tablets of celecoxib were evaluated for hardness, friability, weight variation, disintegration time and dissolution. Dissolution tests of Press coated pulsatile release tablets of celecoxib were conducted in USP dissolution apparatus containing

Antioxidant and HPTLC fingerprinting analysis of *Desmostachya bipinnata*

¹K. Ashok Kumar, ²P. Pragathi and ³Jitendra Patel

Associate Professor, Research Scholar and Associate Professor

^{1&2}Vignani Institute of Pharmaceutical Sciences, Hyderabad.

³Avanhi Institute of Pharmaceutical Sciences, Guntha Hyderabad.

Abstract: In current investigation, a popular ayurvedic crude drug *Desmostachya bipinnata* also known as darbha was studied for in-vitro antioxidant activity. The drug has been identified by HPTLC fingerprint analysis. The dried rhizome and roots were pulverized into fine powder. Required quantity of powder was employed for successive extraction by using soxhlet apparatus. The successive extracts were used for HPTLC fingerprint investigations, while the Hydro-alcoholic extract was prepared separately for antioxidant studies. A silica gel 60F₂₅₄ TLC precoated aluminium plates (10 x 10 cm, layer thickness 0.2mm, Merck, Mumbai) were employed as a stationary phase. About 1 µL of the sample was applied on the TLC plate under a stream of nitrogen using a semiautomatic spotter and the bands were detected employing a deuterium lamp. The chromatographic conditions were optimized and estimations were performed on a stationary phase, pre coated silica gel60 F₂₅₄ aluminum sheets (10 x10) which were prewashed with the n-hexane (for n-hexane extract), chloroform (for chloroform extract) and methanol (for methanol extract) and dried in air. Then the plated were saturated with the respective mobile phases for 30 minutes and the migration distance allowed was 72mm. The wave length scanning was performed at 254nm for n-hexane extract and 366nm for chloroform and methanol extract. The source of radiation was deuterium lamp emitting a continuous UV spectrum between 190-400nm. The samples were spotted and developed at 25±2°C. The HPTLC finger prints of n-hexane, chloroform and methanol extracts were developed employing following mobile phases respectively. a) Hexane: ethyl acetate: acetic acid (8:2:0.5 v/v) at 254 nm. b) Toluene: ethyl acetate: acetic acid (8:2:0.2 v/v,) at 366 nm. c) Toluene: ethyl acetate: acetic acid (8:2:0.2 v/v) at 366 nm. The results of the antioxidant study revealed that the plant extract possess effective antioxidant activity. HPTLC fingerprints were developed for rapid identification, authentication and control of adulteration of this crude drug, which is used as one of the ingredient in several ayurvedic formulations.

Keywords: *Desmostachya bipinnata*, HPTLC fingerprinting, Antioxidant activity, DPPH.

I. INTRODUCTION

At present, herbal medicine represents one of the most important fields of traditional medicine all over the world. To promote the proper use of herbal medicine and to determine their potential as sources for new drugs, it is essential to study medicinal plants having folklore reputation in a more intensified way. A huge number of the world's population have exclusively been used medicinal plants for centuries as remedies for human diseases [1]. Knowledge of the chemical constituents of plants is desirable because such information will be value for the synthesis of complex chemical substances. Phytochemical screening of plants has revealed the presence of numerous chemicals including alkaloids, flavonoids, tannins, steroids, glycosides and saponins. Secondary metabolites from plant serve as defense mechanisms against predation by many microorganisms, insects, herbivores and oxidative stress [2]. Oxidative stress induced ROS and free radicals are believed to be major cause of physiological disorders like Alzheimers, Parkinson's, arthritis, atherosclerosis, coronary heart diseases, emphysema, gastric ulcer, diabetes mellitus, cirrhosis, aging and cancer. Presence of a multitudes of vitamins, polyphenols, flavonoids, tannins and phenolic acids in natural extracts of vegetables, fruits, herbs, spices and medicinal plants and inverse relationship between these natural antioxidants and the risk of oxidative diseases has caused spurt in extensive research and have been described to possess biological activities such as antioxidant, anti-inflammatory, oestrogenic, cytotoxic, antitumor [3]. *Desmostachya bipinnata* Stapf (Family: Poaceae) locally named English name- Sacrificial Grass (smaller var.), Ayurvedic name- Kusha, Suuchyagra, Yagyabhuushana, Kshurapatra, Siddha/Tamil name-Tharubai, that is widely distributed throughout the plains of India in hot and dry places. The roots of plant are cooling, diuretic, galactagogue, emollient, aphrodisiac, astringent, used for menorrhagia, diarrhea, dysentery, skin disease, renal and vesical calculi, asthma, jaundice, dysurea, bleeding piles, burning

Dear Dr Balaji,

Thank you for your mail regarding your students visit to NIPER-Hyd and confirming the date and number of students.

Please you can come to NIPER by 10:00 am, then we can make in to 2 or 3 groups accordingly. Also please make your own arrangements for lunch.

Best regards,

Shankar
