Dear Sir,

Sub: Looking for a qualified team who can work for our Organization's Project

Inception Sources Pvt Ltd is an expert strategic developer and commercialization global partner for pharmaceutical, biotechnology and medical device industries. Inception Sources Pvt Ltd experienced Employees, well established programs and processes bring a new dimension to development strategy, regulatory submissions, clinical research, consumer health care, medical and scientific support.

We are looking for a team of qualified faculty members at your college in Pharmacy Department who can work on Effect of Polymer Concentration on Drug Release in the Formulation Controlled Release Tablets of Glipizide Using Various Polymers If your college is interested to work in collaboration. We forward further documentation & I sincerely hope that we can keep the information confidential.

Looking forward & thank you.

Managing Director

Respected Sir / Madam,

We thank you for sharing us the proposed project details.

In this regard, we are happy to inform that our institution is having all the technical resources in terms of Infrastructure and Skilled resources. We are also having faculty members in the specialization required.

We are ready to submit a detailed project proposal with all necessary details upon confirmation from your end.

Thank you once again.

Yours Sincerely

Principal

PROJECT REPORT:

Introduction:

A controlled release drug delivery system delivers the drug locally or systemically at a predetermined rate for a specified period of time the goal of such systems is to provide desirable delivery profiles that can achieve therapeutic plasma levels. Drug release is dependent on polymer properties, thus the application of these properties can produce well characterized and reproducible dosage forms.⁶

The basic rationale of a controlled release drug delivery system is to optimize the bio pharmaceutics, pharmacokinetics, and pharmaco dynamics properties of a drug in such a way that its utility is maximized through reduction in side effects and cure or control of disease condition in the shortest possible time by using smallest quantity of drug, administered by most suitable route. The immediate release drug delivery system lacks some features like dose maintenance, controlled release rate and

Scope of the Project:

A stability indicating RP-HPLC method was developed and validated for the estimation of Emtricitabine (EMT), Rilpivirine (RIL), and Tenofovir Alafenamide (TAF) in combined dosage forms and it's API. Chromatographic separation of these drugs was performed on INERTSIL column, C18 (150x4.6 ID) 5 μ m as the stationary phase using solvent system consisted of Phosphate buffer: Acetonitrile 40:60. The method was validated according to the International Conference of Harmonization (ICH) guidelines. The method showed accuracy of 100.19%, 101.30% and 99.70% and percentage Assay of 100.04%, 99.74% and 102.14% for Emtricitabine, Rilpivirine and Tenofovir Alafenamide, respectively. Percentage relative standard deviation (<2%) was found for both precision and robustness study showing that the Proposed method was precise, specificity, robust and stable in accordance with ICH guidelines.

Project planning and scheduling:

Evaluation of post compression parameters for prepared Tablets

The designed formulation tablets were studied for their physico-chemical properties like weight variation, hardness, thickness, friability and drug content.

Weight variation test:

To study the weight variation, twenty tablets were taken and their weight was determined individually and collectively on a digital weighing balance. The average weight of one tablet was determined from the collective weight. The weight variation test would be a satisfactory method of determining the drug content uniformity. Not more than two of the individual weights deviate from the average weight by more than the percentage shown in the following table and none deviate by more than twice the percentage. The mean and deviation were determined. The percent deviation was calculated using the following formula.

$$\% \text{ Deviation} = (\text{Individual weight} - \text{Average weight} / \text{Average weight}) \times 100$$

Data collection and Analysis:

1. Pre formulation parameters Angle of repose:

The angle of repose was calculated using the following formula:

$$\tan \theta = h/r \quad \tan \theta = \text{Angle of repose}$$

h = Height of the cone, r = Radius of the cone base

Bulk density:

The bulk density was calculated using the formula: Bulk Density = M / V_0

Where,

M = weight of sample

V_0 = apparent volume of powder

Tapped density:

The tapped density was calculated in gm per L, using the formula:

Tap = M/V Where,

Tap = Tapped Density M = Weight of sample

V = Tapped volume of powder

PRINCIPAL

Avanthi Institute of Pharmaceutical Sciences
Gunthapally (V), Hayath Nagar (M),
Ranga Reddy Dist.

Measures of powder compressibility:

For poorer flowing materials, there are frequently greater inter particle interactions, and a greater difference between the bulk and tapped densities will be observed. These differences are reflected in the Compressibility Index which is calculated using the following formulas:

Carr's Index = $[(\text{tap}-b)/\text{tap}] \times 100$ Where, b = Bulk Density
Tap = Tapped Density

Formulation development of Tablets:

All the formulations were prepared by direct compression. The tablets were prepared as per the procedure given below and aim is to prolong the release of Glipizide

Methodology

Analytical method development:

a) Determination of absorption maxima:

10mg of Glipizide pure drug was dissolved in 10ml of Methanol (stock solution). 1ml of above solution was taken and made up to 10ml by using 0.1 N HCl (100 μ g/ml). From this 1ml was taken and made up to 10ml of 0.1 N HCl (10 μ g/ml) and the solution was scanned in the range of 200–400nm. Similar procedure was repeated to pH 6.8 Phosphate buffer UV spectrum was taken using Double beam UV/VIS spectrophotometer.

b) Preparation calibration curve:

10mg of Glipizide pure drug was dissolved in 10ml of Methanol (stock solution). 1ml of above solution was taken and made up to 10ml by using 0.1 N HCl (100 μ g/ml). From this 1ml was taken and made up to 10ml of 0.1 N HCl (10 μ g/ml). The above solution was subsequently diluted with 0.1N HCl to obtain series of dilutions containing 10, 20, 30, 40 and 50 μ g/ml of Glipizide per ml of solution. The absorbance of the above dilutions was measured at 255nm by using UV- Spectrophotometer taking 0.1N HCl as blank.

PRINCIPAL
Avanthi Institute of Pharmaceutical Sciences
Gunthapally (V), Hayath Nagar (M),
Ranga Reddy Dist.

Resources and budget allocation:

It will provide an overview of the resources allocated to the project, including human resources, consumables, techniques, laboratory facilities, contingencies and other project expenses. A detailed budget estimate will be presented considering the costs associated with development of new drug molecule.

Documentation and record keeping:

The outline and the documentation practices employed throughout the project. Proper documentation will facilitate traceability and aid future reference.

Conclusion:

A simple, rapid, accurate, and precise stability-indicating HPLC analytical method had been developed and validated for the routine simultaneous estimation of EMT, RIL, and TAF in API and tablet dosage forms. The RT of EMT, RIL, and TAF using optimum conditions was 2.517, 3.273, and 6.697 min, respectively. The simplicity of the HPLC procedure, the short runtime, and the low volume of injection make this method suitable for quick and routine analysis. The stability indication nature of the analytical method provides confidence to use the developed method in a regulatory environment of the pharmaceutical industry without any further modification.

Respected sir,

Sub: Development of New Analytical Method and Validation of Anti-Neoplastic Agents Netupitant and Palonosetron in Pure and Pharmaceutical Formulation by Rp-Hplc

It gives us great pleasure to let you know that the project proposal for "Development of New Analytical Method and Validation of Anti-Neoplastic Agents Netupitant and Palonosetron in Pure and Pharmaceutical Formulation by Rp-Hplc" has been confirmed. As we discussed in our conversation, we agreed to maintain the confidentiality of the Project. We appreciate you giving us the opportunity to work on your current project, which has to do with the most recent developments in the design sector.

Please be assured that we will make every effort to complete the project as quickly as we can.

Thanking you Sir,

Respected Sir,

Sub: Project Completion-reg.

The project has been completed on a given time bond. It has been a great achievement by us to complete the prestigious project on time. It has been a great privilege, working in association with you and looking forward to working with you in future projects. We request you to please come along with your team for collecting, retrieving of important and confidential data.

Looking forward to a quick response from your side.

Thanking you,

PROJECT REPORT:

Introduction:

A controlled release drug delivery system delivers the drug locally or systemically at a predetermined rate for a specified period of time. The goal of such systems is to provide desirable delivery profiles that can achieve therapeutic plasma levels. Drug release is dependent on polymer properties, thus the application of these properties can produce well characterized and reproducible dosage forms. Netupitant (NTP) is an ovulate metic[1,2] drug in the combination of NTP/ Palonosetron (PLS). It is used to the prevention of acute and delayed chemotherapy-induced nausea and vomiting [include in highly emetogenicity and chemotherapy such as with cisplatin hydroxytryptamine (5-HT₃) receptor are located on the nerve

Scope of the Project:

A stability indicating various polymers was developed and validated for the estimation of Emtricitabine (EMT), Rilpivirine (RIL), and Tenofovir Alafenamide (TAF) in combined dosage forms and its API. Chromatographic separation of these drugs was performed on INERTSIL column, C18 (150x4.6 ID) 5 μ m as the stationary phase using solvent system consisted of Phosphate buffer: Acetonitrile 40:60. The method was validated according to the International Conference of Harmonization (ICH) guidelines. The method showed accuracy of 100.19%, 101.30% and 99.70% and percentage Assay of 100.04%, 99.74% and 102.14% for Emtricitabine, Rilpivirine and Tenofovir Alafenamide, respectively. Percentage relative standard deviation (<2%) was found for both precision and robustness study showing that the

Project planning and scheduling:

Preparation of Standard stock solutions

Accurately weighed 150 mg of Netupitant, 0.25mg of Palonosetron and transferred to individual 50 ml volumetric flasks separately. 3/4 th of diluents was added to both of these flasks and sonicated for 10 minutes. Flasks were made up with diluents and labeled as Standard stock solution 1 and 2. (3000 μ g/ml of Netupitant and 5 μ g/ml of Palonosetron)

Data collection and Analysis:

Optimized method: Chromatographic conditions: Mobile phase: 55%0.1% OP A buffer:
450% Acetonitrile Flow rate : 1ml/min
Column: DiscoveryC18 (4.6x250mm, 5µm) Detector wave length : 240nm
Column temperature: 30°C Injection volume: 10µL Runtime:
6min Diluents: Water and Acetonitrile in the ratio 50:50

Methodology:

Based up on the solubility of the drugs, diluents was selected, Acetonitrile and Water taken in the ratio of 50:50

Preparation of Standard stock solutions

Accurately weighed 150 mg of Netupitant, 0.25mg of Palonosetron and transferred to individual 50 ml volumetric flasks separately. 3/4 th of diluents was added to both of these flasks and sonicated for 10 minutes. Flasks were made up with diluents and labeled as Standard stock solution 1 and 2. (3000µg/ml of Netupitant and 5µg/ml of Palonosetron)

Preparation of Standard working solutions (100% solution)

1ml from each stock solution was pipette out and taken into a 10ml volumetric flask and made up with diluents (300µg/ml Netupitant of and 0.5µg/ml of Palonosetron)

Preparation of Sample stock solutions

5 capsules were weighed and the average weight of each capsule was calculated, then the weight equivalent to 1 capsule was transferred into a 100ml volumetric Flask, 5ml of diluents was added and sonicated for 25 min, further the volume was made up with diluents and filtered by HPLC filters (3000µg/ml of Netupitant and 5µg/ml of Palonosetron)

Preparation of buffer

0.1%OPABuffer: 1ml of Conc Ortho Phosphoric acid was diluted to 1000ml with water.

Method Validation [23,24,26,27,28,29] System suitability parameters The system suitability parameters were determined by preparing standard solutions of Netupitant (300ppm) and Palonosetron (0.5ppm) and the solutions were injected six times and the parameters like peak tailing, resolution and USP plate count were determined. The % RSD for the area of six standard injections results should not be more than 2%.

Specificity

Checking of the interference in the optimized method. We should not find interfering peaks in blank and placebo at retention times of these drugs in this method. So this method was said to be specific.

Resources and budget allocation:

It will provide an overview of the resources allocated to the project, including human resources, consumables, techniques, laboratory facilities, contingencies and other project expenses. A detailed budget estimate will be presented considering the costs associated with development of new drug molecules

Documentation and record keeping:

The outline and the documentation practices employed throughout the project. Proper documentation will facilitate traceability and aid future reference.

Conclusion:

A simple, Accurate, precise method was developed for the simultaneous estimation of the Netupitant and Palonosetron in pharmaceutical dosage form. Retention time of Netupitant and Palonosetron were found to be 2.308min and 3.093min. %RSD of the Netupitant and Palonosetron were and found to be 0.9 and 0.6 respectively. %Recovery was obtained as 99.51% and 99.29% for Netupitant and Palonosetron respectively. LOD, LOD values obtained from regression equations of Netupitant and Palonosetron were 1.84, 0.01 and 5.59, 0.03 respectively. Regression equation of Netupitant is $y = 7232.8x + 3439.3$ and of Palonosetron is $y = 28857x + 97.732$. Retention times were decreased and run time was decreased, so the method developed was simple and economical that can be adopted in regular Quality control test in Industries.
