Formulation and *in vitro* Evaluation of Topical Liposomal Gel of Acitrecin and Methotrexate

Dr.Jithendra Patel,Mohammed salman

Avanathi Institute of Pharmaceutical Sciences,Hyderabad,Telangana,India.

ABSTRACT

Acitrecin and Methotrexate used in treatment of skin inflammatory diseases. liposomes can increase the deposition of drugs within the skin at the site of action and reduce side effects of drug. The aim of the present study was to formulate and evaluate liposomal vesicles loaded with Acitrecin and Methotrexate. liposomes containing Acitrecin and Methotrexate were prepared using thin film method. The quantities of lecithin and cholesterol were changed to enhance the encapsulation of the drug. Carbomer 940 was used as gel base and four different gel formulations including hydroalcoholic gel, MLV liposomal gel, SUV liposomal gel and blank MLV gel containing free drug were prepared. The release profile of Acitrecin and Methotrexate was determined using dialysis membrane method. Liposomes were also characterized by optical microscope and their particle size was also determined. Formulation containing lecithin: drug: cholesterol (100: 10: 10) having about 90.05 percent encapsulation was selected as the best formulation and the results of release showed SUV liposomal gel has the most regular and the least interaction between the drug and polymer. Results of particle size determination showed 50% of MLV and SUV liposomes had diameter below 33.80 μm and 22.09 μm , respectively. The results of characterization of the vesicles indicated the potential application of Acitrecin and Methotrexate loaded liposome as carrier system.

Key words: Acitrecin and Methotrexate, liposome, thin film, gel

INTRODUCTION

Transdermal drug delivery has many advantages over the other traditional routes of administration. But, the barrier nature of the skin is a significant obstacle for most drugs to be delivered into and through it. Many researchers have been investigated the liposomes as drug delivery systems that can improve transdermal drug delivery. Liposomes are spherical vesicles with concentric phospholipid bilayers [1]. The results of some studies have been indicated that liposomes can increase the deposition of drugs within the skin at the site of action and reduce its absorption into blood [2, 3]. Lipid bilayered membrane encloses an aqueous core that hydrophilic drugs get entrapped in the central aqueous core of the vesicles while lipophilic drugs get entrapped within the bilayered membrane [4]. Drugs encapsulated in liposomes can be transported without rapid degradation and minimum side effects to the recipients [5]. Liposomes have many advantages such as, biocompatibility and biodegradability, prolonging release of active pharmaceutical agents, ability to entrap lipophilic and hydrophilic drugs, protecting encapsulated agents from metabolic processes, nontoxicity, penetration enhancing and slow drug release [6-10].

Acitrecin and Methotrexate is a glucocorticoid that it is used in treatment of allergic reactions, asthma, rhinitis and other inflammatory diseases. Mechanism of action of the drug is control of the synthesis of prostaglandins and leukotrienes [11].

The aim of the present study was to prepare and evaluate topical liposome gel formulation of Acitrecin and Methotrexate and to study their *in vitro* release behavior.

DESIGN AND CHARACTERIZATION OF LIPOSOMAL
LOADED GELS FOR TRANSDERMAL DRUG DELIVERY OF
FLUVASTATIN SODIUMB. Manjula¹, V. Rama Mohan Gupta², K. B. Chandra Sekhar³¹Research scholar, JNTU Ananthapuram, Ananthapuram.²Department of Pharmaceutics, G. Pulla Reddy College of Pharmacy, Hyderabad³Vice Chancellor, Krishna University, Machilipatnam.**Abstract:**

In the present study, an attempt was made to develop the transdermal drug delivery systems of Fluvastatin sodium using Liposomes incorporated in a gel, which will control the release of drug, increasing the bioavailability of the drug and thus decreasing the dosing frequency of the drug. It was designed by encapsulating the drug in various Liposomal formulations composed of various ratios of Soya Lecithin: Span 80 or Tween 80 or sodium deoxycholate. The Liposomes were prepared by rotary evaporation sonication method. Lipid: surfactant ratio of 90:10 is found to be more effective when compared to other ratios. Experimental results of the present study showed that deformable lipid vesicles improve the transdermal delivery, prolong the release, and improve the site specificity of the Fluvastatin sodium. The drug diffusion studies showed that the prepared liposome vesicles followed zero order kinetics and mechanism of drug diffusion followed peppas model.

Key Words: Liposomes, Anti-hyperlipidemic, Controlled release, Lipid, Surfactant.
